```

Pred. No. 18 the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

transepithelial transport.
SUBCELLULAR LOCATION: Integral membrane protein.
SIMILARITY: Belongs to the chloride channel fami
SIMILARITY: Contains 2 CBS domains.
                                           . Genet. 10:466-471(1995).
FUNCTION: Voltage-gated chloride channel. Chloride channels have several functions including the regulation of cell volume; membrane potential stabilization, signal transduction and
                                                                                                                                                                                                                                                                                                                                         255 SSLAHPORKISMT-----YVHSAVLAGGVAVGTSCHLİPSPWLAMVLGLVAĞLISİ

LINES EXPRESSING

ISOId=P18577-4; Sequence=VSP 005701;
TISSUE SPECIFICITY: RESTRICTED TO TISSUES OR CELL LINES EXPRESS
EXTHROID CHARACTERS.

POLYMORPHISM: RhCE and RhD are responsible for the RH blood gr.
system. The molecular basis of the ErRh3/erRh5 blood group
antigens is a single variation in position 225; pro-225
corresponds to Rh3 and Ala-225 to Rh5. The molecular basis of
c=Rh2/c=Rh4 blood group antigens is a single variation in posi
102; Ser-102 corresponds to Rh2 and pro-102 to Rh4.
SIMILARITY: BELONGS TO THE RH FAMILY. STRONG, TO RHD. s of the position group

SUBCELLULAR LOCATION: Integral membrane protein.
TISSUB SPECIFICITY: Kidney specific.
SIMILARITY: Belongs to the chloride channel family.
SIMILARITY: Contains 2 CBS domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    FUNCTION: Voltage-gated chloride channel. Chloride channels several functions including the regulation of cell volume; membrane potential stabilization, signal transduction and

FINCTION: Voltage-gated chloride channel. Chloride channels have FUNCTION: Voltage-gated chloride channel. Chloride channels have several functions including the regulation of cell volume; membrane potential stabilization, signal transduction and transepithelial transport. May play an important role in renal tubular function.

SUBJECTIONAR LOCATION: Integral membrane protein.

TISSUE SPECIFICITY: Ridney specific.

SIMILARITY: Belongs to the chloride channel family.

SIMILARITY: Contains 2 CBS domains.

                                                                                                                                                                         SUBCELIULAR LOCATION: Integral membrane protein.
TISSUE SPECIFICITY: Kidney. Moderately expressed in aortic
vascular smooth muscle and endothelial cells, and at a sligh
higher level in the coronary vascular smooth muscle.
DISEASE: Defects in CLCN5 are a cause of X-linked recessive
hypophosphatemic rickets (XIRM) [MIM:300008].
DISEASE: Defects in CLCN5 are the cause of idiopathic low
molecular weight proteinuria of japanese children (JILP)
renal failure.

DISEASE: Defects in CLCN5 are the cause of X-linked recessive

nephrolithiasis type 1 (NPHL1) [MIM:310468]; also designated XRN.

NPHL1 is characterized by hypercalciuria, nephrocalcinosis, renal
                                                                                   [MIM:300008].

DISEASE: Defects in CLCN5 are the cause of X-linked recessive nephrolithiasis type 2 (NPHL2) [MIM:300009]; also known as Dent disease. NPHL2 is a renal form of Fanconi syndrome, characterized by hypercalciuria, nephrocalcinosis, renal stones and progressive
                                                                                                                                                                                                                                                                                                                                           FUNCTION: Voltage-gated chloride channel. Chloride channels several functions including the regulation of cell volume, membrane potential stabilization, signal transduction and transepithelial transport. May play an important role in ren
                                                                                                                                                                                                                                                                                                                             tubular function.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  or send an email to license@isb-sib.ch).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         plastoquinol.
SUBCELUTLAR LOCATION: Integral membrane protein (Potential).
SIMILARITY: Belongs to the complex I subunit I family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       translocation (for every two electrons transferred, four hydrogen ions are translocated across the cytoplasmic membrane), and thus conserves the redox energy in a proton gradient (By similarity). CATALYTIC ACTIVITY: NAD(P)H + plastoquinone = NAD(P)(+)+
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   sulfur (Fe-S) centers, to quinones in the respiratory chain. The immediate electron acceptor for the enzyme in this species is believed to be plastoquinone. Couples the redox reaction to proton

Pred. No.	is the number of results predicted by chance to have a

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
